

WHAT IS IT

NuBred is a multi-actor platform where every user sees only the portion of the ecosystem that belongs to their role. This document defines the four actor roles, their two possible states (Active or Pending), the navigation structure for MVP, the seven internal project sections, and the visibility rules that govern what each role can see and do.

WHY IT EXISTS

A grower must never see another grower's data. A packhouse must never see contracts it is not party to. A nursery must never see IP Rights. The Variety Manager sees everything. Visibility is not a UX preference — it is a governance requirement. Every visibility decision in this document exists to protect the integrity of the ecosystem and the trust of every actor within it.

MVP NAVIGATION STRUCTURE

The main menu contains three items only. All project complexity lives inside the project, navigated via an internal tab bar. This structure is permanent — adding new modules in the future never requires touching the main menu.

Level	Items
Main Menu	Projects · Notifications · Profile
Inside a Project	Overview · Genotype · Supply Chain · Phases · Contracts · IP Rights · To-Do
Out of MVP	Quarantine · Chronology — designed later, not in MVP tab bar

The tab bar inside a project shows all 7 sections. Sections the user cannot access are greyed out and non-clickable — they are visible but inactive. This communicates the structure of the platform without exposing restricted data.

THE FOUR ROLES

Roles are always project-specific. A user can be Variety Manager in one project and Grower in another. There is no global role in NuBred — the role is always relative to a specific project.

Role	Who they are	Creates Projects	Invited by
Variety Manager	Breeder, licensor, or variety management company. Primary account holder and project owner.	☑ Yes	—
Nursery	Authorized propagation facility supplying certified planting material.	✗ No	Variety Manager
Grower	Licensed producer who plants and harvests the protected variety.	✗ No	Variety Manager

Packhouse / Marketer	Processing, grading, and commercial distribution facility or entity.	✗ No	Variety Manager
Field Observer	The human NuBred Node. A functional role added to any existing account — a user can be Grower AND Field Observer in the same project, or Field Observer only. Assigned by VM to specific genotypes or plots. Collects observation data in field using mobile interface. Will be replaced by NuBred Node hardware.	✗ No	Variety Manager
NuBred Admin	Eagle Apps back-office. Manages Benchmark Registry, Glossary, Clause Library, Protocol templates. Not visible in client-facing MVP.	N/A	Internal only

ACTOR STATES — ACTIVE & PENDING

Every actor invited to a project has one of two states. These states are simple and binary in MVP — we do not distinguish operational states (planting, harvesting, off-season) at this stage. That complexity is added post-MVP when real usage data informs the design.

State	Definition	How it appears in Supply Chain diagram
Active	The actor has accepted the invitation and activated their NuBred account.	Node shown with green Active badge. All accessible sections visible.
Pending	The actor has been invited by the Variety Manager but has not yet activated their account.	Node shown with grey Pending badge. VM can see the node but cannot interact with actor data yet.

A Pending actor who logs in for the first time sees an onboarding screen explaining: what the project is, what their role is, and what they will need to do. They do not see an empty dashboard — they see a clear starting point.

THE 7 PROJECT SECTIONS — MVP

These are the seven sections accessible inside every project for MVP. Each section is populated by NuBred's AI during project creation and confirmed by the Variety Manager. Sections can be updated at any time by uploading new documents.

Section	What it contains	Who can edit
Overview	AI-generated Governance Model with 13-parameter rating, project summary, species, territory, start date.	Variety Manager confirms AI extraction. Read-only for all other roles.
Genotype	Species and all genotypes/varieties in the project. Each genotype linked to its phases, IP rights, and observations.	Variety Manager. Grower and Nursery see only genotypes linked to their contracts.
Supply Chain	Visual diagram of all actors as nodes. Edges labelled with the contract governing each relationship. Active/Pending badges on each node.	Variety Manager edits. All other roles see their own segment only.
Phases	Trial, Pilot, Launch, Scale phases with objectives, duration, location, gate criteria, and genotype decisions (Promote / Repeat / Discard).	Variety Manager. Other roles read-only or hidden per visibility matrix.

Contracts	All uploaded contracts with AI clause analysis. Each clause shows status (present/absent), risk flag, cited source, and VM notes.	Variety Manager sees all. Other roles see only contracts they are party to.
IP Rights	PBR, Patent, and Trademark records extracted from contracts and IP documents. Linked to genotypes and contracts.	Variety Manager only. All other roles: hidden.
To-Do	Per-actor task list generated from contract obligations + NuBred phase framework. Each task has title, due date, category, assigned actor, and cited source.	Variety Manager sees all tasks. Each actor sees only their own tasks.

SECTION VISIBILITY BY ROLE

Section	Variety Manager	Nursery	Grower	Packhouse	Field Observer	NuBred Admin	
Overview	Full	Read only	Read only	Read only	Hidden	Full	
Genotype	Full	Own only	Own only	Hidden	Hidden	Full	
Supply Chain	Full diagram	Own segment	Own segment	Own segment	Hidden	Full	
Phases	Full	Read only	Read only	Hidden	Own assigned	Full	
Contracts	All contracts	Own contracts	Own contracts	Own contracts	Hidden	Full	
IP Rights	Full	Hidden	Hidden	Hidden	Hidden	Full	
To-Do	All actors tasks	Own tasks only	Own tasks only	Own tasks only	Hidden	Full	

Hidden means the tab item is greyed out and non-clickable. Own only or Own segment means the actor sees only data linked to their contracts and their portion of the supply chain. Read only means the actor can view but not edit.

NAVIGATION BEHAVIOR

Scenario	Behavior
Section inaccessible for this role	Tab item is visible in the tab bar but greyed out and non-clickable. No lock icon, no explanation message. The user understands they do not have access without needing to be told.
Actor is Pending (not yet activated account)	Pending badge shown on their node in Supply Chain diagram. VM can see the node but cannot view actor-specific data. Pending actor sees an onboarding screen on first login explaining their role and upcoming obligations.
User has multiple roles across different projects	Roles are project-specific. A user who is Variety Manager in Project A and Grower in Project B sees each project with the correct role and visibility. There is no global role — role is always relative to a specific project.
Role change after invitation	Only the Variety Manager can change an actor's role within a project. All historical data linked to the previous role is preserved and never deleted.

Actor invited but already has a NuBred account	The project appears in their Projects list immediately. Status is Active from the moment they accept the invitation — no separate activation step required if account already exists.
--	---

ACCESS FLOW — FROM INVITATION TO ACTIVE PROJECT

#	Actor	Action	Result
1	Variety Manager	Creates a new project and uploads documents.	AI analysis begins. Project draft created.
2	Variety Manager	Reviews AI extraction section by section. Confirms or edits each section. Uploads additional documents if needed.	Each confirmed section is locked as reviewed. Project moves toward Active status.
3	Variety Manager	Invites actors via email, assigning each a role (Nursery / Grower / Packhouse).	Invited actors receive email. Their nodes appear in Supply Chain with Pending badge.
4	Invited Actor	Clicks email link. Creates NuBred account via Clerk (if new) or logs in (if existing). Accepts invitation.	Actor status changes from Pending to Active. Their project view activates with role-appropriate visibility.
5	All actors	Each actor sees their section of the project. VM sees full project. Others see their permitted sections only.	Project is live and operational.

DECIDED — DO NOT REOPEN

- Main menu has exactly 3 items: Projects, Notifications, Profile
- There are exactly 7 internal project sections in MVP: Overview, Genotype, Supply Chain, Phases, Contracts, IP Rights, To-Do
- Quarantine and Chronology are out of MVP — designed later
- Inaccessible sections are greyed out in the tab bar — not hidden, not locked
- Actor states are binary in MVP: Active (account activated) or Pending (invited, not yet activated)
- Roles are project-specific — there is no global role in NuBred
- Only the Variety Manager can invite actors and change roles
- Historical data is never deleted when a role changes
- Authentication is handled exclusively by Clerk — no custom auth

OPEN — TEAM TO IMPLEMENT

- Design of the project tab bar component with greyed-out inactive states
- Active / Pending badge design for Supply Chain diagram nodes
- Onboarding screen for Pending actors on first login — project summary + role explanation + upcoming obligations
- Notification design — which events trigger alerts and for which roles
- Empty state design for sections with no data yet populated by AI
- Profile page — personal data, list of projects with role per project, language preferences

DO NOT

- Do not add items to the main menu — all new modules go inside the project tab bar
- Do not show another grower's data to any grower role
- Do not show IP Rights to any role other than Variety Manager and NuBred Admin
- Do not build operational active/passive states beyond account activation in MVP
- Do not create a global role system — roles are always project-specific
- Do not allow any role other than Variety Manager to invite actors or change roles
- Do not hide inaccessible tabs — grey them out so the structure of the platform is always visible
